

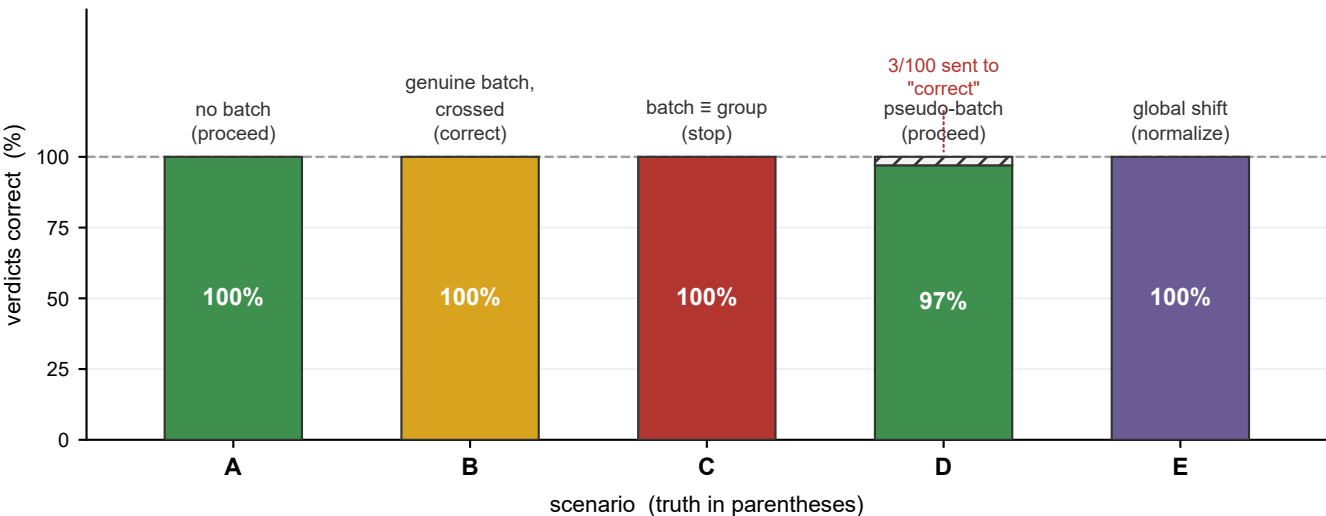

Fig. 2 Verdict accuracy against known ground truth: 497/500 = 99.4%

100 replicates per scenario, 1,500 genes, $n = 15$ per group, 200 permutations. Hatched segment = residual error. Every residual error is in D, where random labels showed weak separability and were conservatively sent to "correct" rather than "proceed". Scenario C, the case detect-then-correct pipelines mishandle, was stopped in 100/100 replicates.
