

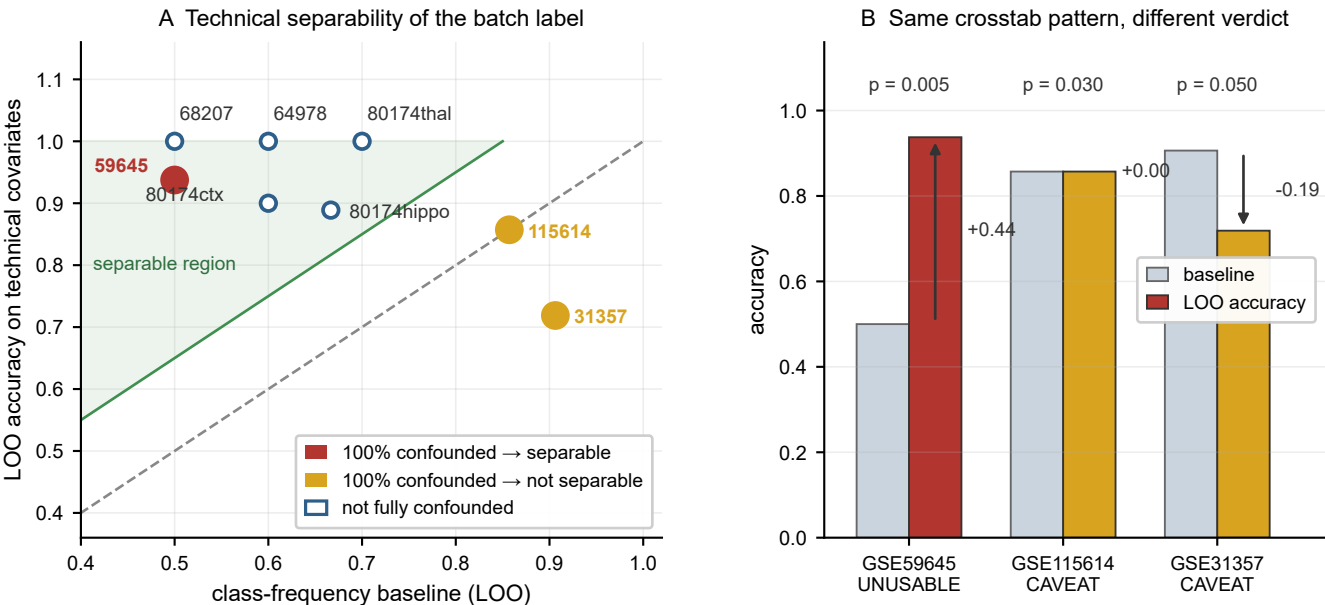

Fig. 6 A structural confounding alarm is not evidence of a batch effect

All three units have every experimental group in a single batch level (100% structural confounding). Only GSE59645 also clears the separability gate (gain ≥ 0.15 , $p < 0.05$) with measured scan dates and PC1 R2(batch) = 0.961; the other two carry no technical signal and are a numbering artefact. Separability requires gain ≥ 0.15 and $p < 0.05$.
